Mr. Pickles Lanman's TLDR:

Mixed

- SpaceX's management really did guide to roughly 2.5 to 3 GW of AI compute by the end of 2026 and at least 13 GW by the end of 2027, a far faster buildout than Microsoft, Oracle or CoreWeave have shown.
- The author argues the market is ignoring this because the stock closed Oct 30 at $134.72, just under its $135 IPO price.
- The revenue case multiplies 13 GW by 90% rented by $50 per watt to get about $585B a year, which assumes almost all compute is rented at the top of today's price range.
- Most quotes and comparison numbers check out, but the jump from guidance to a near-certain $100T outcome is opinion, not analysis.

TRUTH CHECK Most cited facts hold up. That includes the earnings-call quotes, Microsoft's 12 GW and 1 GW a quarter, Oracle's 850 MW quarter, Deutsche Bank's $35B per GW and the $134.72 close. The weak point is the revenue math. The 90% rental share misreads Musk, who said on the Q3 call the goal is a roughly 50-50 split between internal use and renting. Also, $50 a watt is the top of today's quoted range, not a floor.

Serif text is the author's, unchanged. Underlines and numbers point to Pickles' margin notes.

A couple days ago Elon said 3 gigawatts in december and 13 gigawatts next year. I went back and sat with it. I don't think anyone has actually done the math on what he said. This is the most insane guidance a company has ever put out in public. And the market shrugged. So let me explain. 1. What he actually said Q3 call, 20 Oct: "I will be surprised if we're brought on less than 13 gigawatts[1] of compute by the end of next year." Then 31 Oct on X: "around 1.2M Blackwells at Colossus 2 by end of year" Companies don't say things like this out loud. Most give you a capex range and hide the rest. 2. The pace so far Jun 2025: 0.4 GW[2] Sep 2025: 0.6 GW Mar 2026: 1.0 GW Jun 2026: 1.4 GW Sep 2026: 1.7 GW Dec 2026: ~3 GW The whole year to September added 1.1 GW. Q4 alone adds ~1.3 GW. One quarter beats the year before it. My math. 3. What "fast" means for everyone else Microsoft adds about 1 GW a quarter.[3] When it did that, a UBS analyst on the call called it "extraordinary". Oracle had its record quarter this summer. 850 MW and more than 300,000 GPUs. CoreWeave, the biggest neocloud, needed 18 months to go from 0.36 GW to 1.5 GW active. SpaceX's 2027 plan is +10 GW in one year. That's ~2.5 GW every quarter, 2.5x Microsoft's "extraordinary". My math. 4. 13 GW vs a whole hyperscaler Microsoft runs about 12 GW of data centers in total,

1 · TRUTH CHECK: CONFIRMED
The 13 GW quote is real
The transcript reads "I would be surprised if we brought on less than 13 gigawatts of compute by the end of next year." Musk also said he is "fairly confident" of 10 GW added in 2027. The wording is slightly off, but the meaning is accurate. Keep in mind that this is a target, not something delivered.
Q3 2026 call transcript (Motley Fool)

2 · TRUTH CHECK: CONFIRMED
Ramp figures match company disclosures
The CFO reported 400 MW a year before Q2, then 1 GW in Q1 and 1.4 GW in Q2. Q3 ended at 1.7 GW, with 2.5 to 3 GW guided for year-end. The author's history is accurate, and the "my math" labels are honest.
Q2 2026 call transcript (Investing.com) · Q3 2026 call transcript (Motley Fool)

3 · TRUTH CHECK: CONFIRMED
Microsoft pace and UBS quote
Nadella said Microsoft "added nearly one gigawatt of total capacity this quarter alone." UBS's Karl Keirstead called it "extraordinary." Microsoft's figure counts total capacity, so the "2.5x Microsoft" chart compares mixed units. The chart footnote says so.
Microsoft FY26 Q2 call

per Bloomberg.[4] Built and leased over decades. SpaceX plans to pass that by the end of next year. On AI compute alone. The first Colossus came online in September 2024. 100k H100s, built in 122 days. 5. 1.2M Blackwells Meta's biggest cluster, Prometheus, is working toward roughly 1 million GPUs at full scale. Colossus 2 gets 1.2M Blackwells by December. Elon says they turn on ~200,000 GB300s a month.[5] That's ~600k a quarter, about 2x Oracle's record quarter. My math. 6. And they do it for less 2026 capex: Amazon ~$220B. Google $195-205B. Microsoft ~$170B. Meta $135-145B. SpaceX: ~$83-88B for the whole year. My math, $48.1B in nine months plus the $35-40B Q4 guide. Deutsche Bank puts SpaceX at ~$35B per GW vs ~$50B for the industry.[6] Less money, more gigawatts.[7] SpaceX casts its own turbine blades and brings its own power. Vertically integrated from the power plant to the app. 7. Why nobody prices it Everyone is short of compute. Microsoft: "Customer demand continues to exceed available supply." Amazon says customers take capacity almost as fast as it's installed. So every watt gets rented. $50 a watt a year is the floor.[8] 13 GW x 90% rented x $50 = ~$585B a year.[9] My math. Elon's own range for end-2027 ARR is $500B to $1T. SpaceX trades under $2T today. Analysts extrapolate the past. They see a rocket company that sells internet. SpaceX tells you the future in public, then beats it.[10] "Over 2 gigawatts" in August became ~3 GW by December. 8. My read Again This is the most insane guidance a company has ever put out in public. And the market acted like its just crazy elon talk. In a year people will look back at these 13 days and ask how it was ever priced like this. SpaceX is THE buy. $100T is a matter of time.[11] $SPCX

4 · TRUTH CHECK: CONFIRMED

Correct, but mostly not AI

Bloomberg reported about 12 GW, of which only about 2 GW runs AI-specific chips. Microsoft has not confirmed the figure. The chart itself admits the comparison is "not like for like": total data center power versus SpaceX's "nameplate compute." The direction of the point stands, but the units differ.

GCN on Bloomberg report

5 · TRUTH CHECK: CONFIRMED

Real quote, messy transcript

Musk said SpaceX will "bring roughly 200,000 GB300s online per month" for the rest of the year. The same transcript elsewhere says 20,000 a month, so the record is inconsistent. His Oct 31 building counts (about 220k each) fit the 200,000 reading better.

Q3 2026 call transcript (Motley Fool) · Tesla North on Musk posts

6 · TRUTH CHECK: CONFIRMED

Deutsche Bank figure checks out

Deutsche Bank analyst Edison Yu estimated about $35B per gigawatt versus an industry standard of about $50B, and raised the price target to $250. That is one analyst's estimate, not a cost SpaceX has disclosed.

CNBC

7 · PICKLES' TAKE

The cost lands in 2027

This sets SpaceX's 2026 spending against its 2027 gigawatt target. At Deutsche Bank's own $35B per GW, adding 10 GW in 2027 means about $350B of spending in one year. That is more than any 2026 hyperscaler budget listed here. JPMorgan asked on the call how SpaceX will fund it. The piece skips that question.

CNBC on Deutsche Bank note · Q3 2026 call transcript (Motley Fool)

8 · PICKLES' TAKE

$50 is a ceiling, not floor

The CFO said pricing tracks "slightly above the high end of the $30 to $50 per watt range." That is today's top price, not a floor. Q3 AI revenue was $7.6B, about $30B a year, on 1.4 to 1.7 GW. That is roughly $18 to $22 per watt actually earned. My math.

Q3 2026 call transcript (Motley Fool)

9 · TRUTH CHECK: MISLEADING

90% rented contradicts Musk

On the Q3 call, Musk said the goal is to split compute between internal use and third-party rental "50-50, more or less." His August "10%" figure was about Grok training only. Running Grok for users also uses compute that isn't rented out. At 50% rented, the same math gives about $325B. My math.

Q3 2026 call transcript (Motley Fool) · Q2 2026 call transcript (Investing.com)

10 · TRUTH CHECK: MISLEADING

Not beaten yet

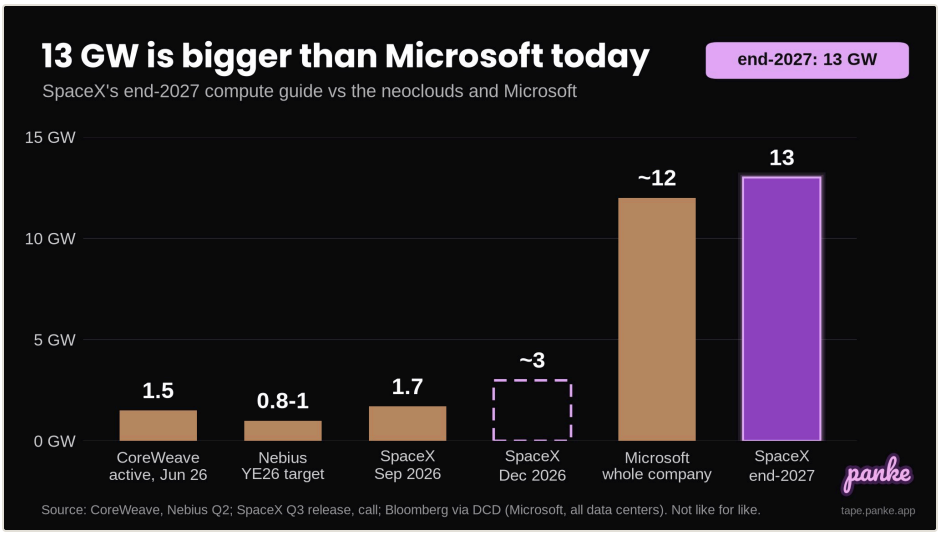

The ~3 GW is a December target, not a result. The Q3 call had already guided 2.5 to 3 GW, so the Oct 31 post sits inside that guide rather than beating it. In September, Musk floated about 1.44M chips by December, and the new total is about 1.2M Blackwells. The counts aren't strictly comparable, but this isn't a clean beat.

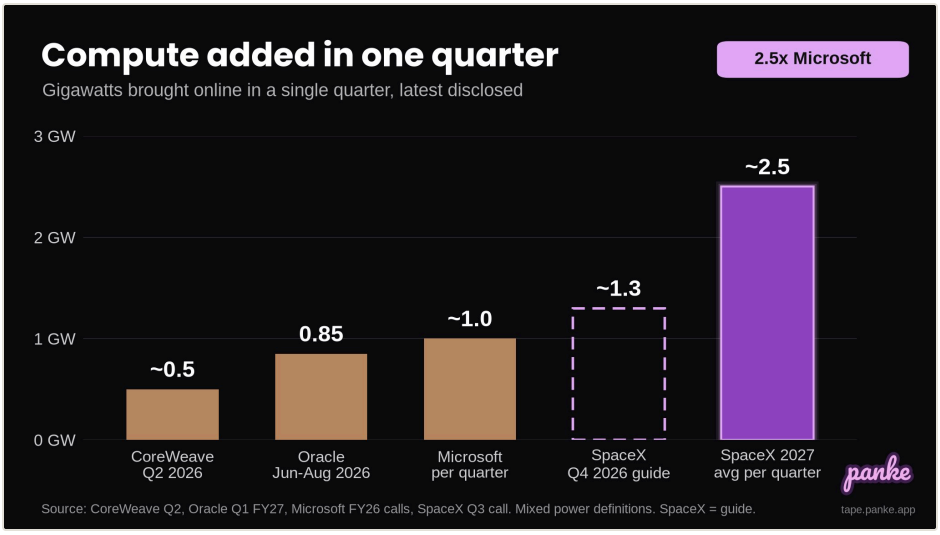

Tesla North on Musk posts · Q3 2026 call transcript (Motley Fool)

11 · PICKLES' TAKE

Big leap from the evidence

$100T is more than 50 times today's roughly $1.83T value. My math. Nothing in the piece supports that. Even the author's own aggressive math reaches about $585B in yearly revenue. That leaves out costs, funding, chip supply, competition and falling prices. Treat this line as cheerleading, not a conclusion.

Quoting @spcxGOD: SpaceX guided "over 2 gigawatts" of compute by year end. That was 4 August. 88 days ago. Tonight Elon says around 1.2M Blackwells at Colossus 2 by year end. That's ~3 GW. 50% more compute than guided. And the stock closed Friday at $134.72, under its $135 IPO price[12] *lol Here's everything you need to know. 1. The ramp Dec 2025: 0.8 GW Mar 2026: 1.0 GW Jun 2026: 1.4 GW Sep 2026: 1.7 GW Dec 2026: ~3 GW Jan to Sep added 0.9 GW. Q4 alone adds ~1.3 GW. One quarter beats the three before it combined. 2. How the guide moved 4 Aug, Q2 call, Elon: "We expect to end this year with over 2 gigawatts of compute." 20 Oct, Q3 call, Elon: "the roughly 3 gigawatts, maybe 2.5 to 3 gigawatts that we'll have online by the end of this year" 31 Oct, Elon on X: "around 1.2M Blackwells at Colossus 2 by end of year" 2027 got raised too. August: "closer to 10 gigawatts of compute than 5 gigawatts of compute". October: he'd be surprised by anything under 13. Guide, beat, raise, repeat lol 3. The names Colossus 2's buildings are now called Macroharder, Minihard, Gun Range and Spam. Somewhere in Redmond, Microsoft is reading "Macroharder" and not laughing lol Minihard has 220k GB300s. Nothing mini about it. Gun Range opens end of November. Fitting, SpaceX keeps shooting past its own guidance. Spam used to house Hormel products. In December it holds ~200k GB300s for inference. That's ~0.4 GW, or ~$20B a year at $50 a watt. Most valuable can of Spam ever made. 4. What ~3 GW is worth CFO Bret Johnsen on the Q3 call: pricing is tracking "slightly above the high end of the $30 to $50 per watt range". $50 a watt a year = $50B a year for every GW. Elon said in August maybe 10% of compute goes to Grok training.*[13] *So rent out the other 90%: 3 GW x 90% x $50 = $135B a year from compute Add Starlink and launch at their Q3 pace, $7.0B a quarter: +$28B ~$163B of run rate going into 2027. Now line it up: $58B: Q3 revenue x 4 $100B: the December ARR goal everyone called crazy $132-148B: the Q1 2027 guide ($33-37B) x 4 ~$163B: what ~3 GW can earn The "crazy" $100B is now the floor. And the Q1 guide only needs ~2.1-2.4 GW rented at $50 a watt. They'll have ~3. My read: that guide is sandbagged. 5. Why this is so bullish Payback. Bret: new compute is "generating a payback of less than a year". Every GW that lands early is a year of revenue nobody modeled. Price. Elon in August: memory supply grows "around 20% per year", demand "by 200% a year, maybe higher". His words: "Economics 101 would suggest that the price increases; it does not decrease." My read: $50 a watt is the floor, not the ceiling. Scale. ~3 GW is the launch pad. 13 GW at $50 a watt is $650B a year. Elon's own range for end of 2027: $500B to $1T of ARR. 6. Receipts The night of the Q3 call I posted "$125-$150 B ARR from compute alone by the end of 2026". Tonight's 1.2M Blackwells puts it at $135-150B. Bears said 2 GW*

12 · TRUTH CHECK: CONFIRMED

Price right, cause unclear

SPCX closed Oct 30 at $134.72, down 6.4%, for a market value of about $1.83T. Coverage points to a tech-wide sell-off and Intel guidance on that day. A big share unlock was also in the news. That isn't proof the market is "shrugging" at compute guidance.

FinanceFeeds

13 · TRUTH CHECK: MISLEADING

Training isn't all internal use

The quote is accurate: "maybe 10% of our compute to be used for Grok training." But the rest is not all rented. Musk said internal use also includes running Grok for users, and in October he gave a 50-50 target. The $135B and $163B figures overstate rentable capacity.

Q2 2026 call transcript (Investing.com) · Q3 2026 call transcript (Motley Fool)

> *was a stretch. Said $100B ARR was crazy. Said Elon always misses deadlines. He's ending the year 50% above the guide. $1.83T company. ~$163B run rate. That's ~11x. You are still very insanely early lol $SPCX*
